"The U.S. Department of Agriculture (USDA) prohibits discrimination in all its programs and activities on the basis of race, color, national origin, age, disability, and where applicable, sex, marital status, familial status, parental status, religion, sexual orientation, genetic information, political beliefs, reprisal, or because all or a part of an individual's income is derived from any public assistance program. (Not all prohibited bases apply to all programs.) Persons with disabilities who require alternative means for communication of program information (Braille, large print, audiotape, etc.) should contact USDA's TARGET Center at (202) 720-2600 (voice and TDD). To file a complaint of discrimination write to USDA, Director, Office of Civil Rights, 1400 Independence Avenue, S.W., Washington, D.C. 20250-9410 or call (800) 795-3272 (voice) or (202) 720-6382 (TDD). USDA is an equal opportunity provider and employer."

Fugle's Mill Demonstration Site

(1985-2006)

*Compiled by Michael Knudson, Forester
USDA-NRCS Plant Materials Center, Bismarck, North Dakota*

Introduction

Since the formation of the USDA Soil Conservation Service (SCS) in 1935, the agency has been actively involved in plant development. A number of regional nurseries were operated by SCS employees to produce grass seed and trees and shrubs for all types of conservation practices. Nationally, more than 425 million pounds of seed were harvested by SCS nurseries and Soil Conservation Districts in 1950. These SCS nurseries continued to produce large scale quantities of plants and seed until 1953. At that time many of the nurseries were converted to Plant Materials Centers (PMC). The mission of the Plant Materials Program is to provide plant solutions and technology to a wide range of conservation needs.

Objective

The objective is to assemble and evaluate woody plant materials for conservation use in the Northern Great Plains. The goal of this field evaluation planting is to provide, under culture and management, a diversity of long-term testing locations for the comparative field evaluation of new cultivars.

Cooperators

In 1985, the USDA Natural Resources Conservation Service, formerly the Soil Conservation Service, signed a project agreement with the Minnesota Department of Natural Resources, the Olmsted Soil and Water Conservation District, the Hiawatha Valley Resource Conservation and Development Area, and the Southeastern Minnesota Association of Soil and Water Conservation Districts.

Site Description

The Fugle's Mill Demonstration Site is located in the rolling hills southeast of Rochester, Minnesota. Fugle's Mill was built by Mathew Fugle and was in operation from 1850-1874. The demonstration site is across the road from the mill, situated between County Road 1 and the Root River. The legal description is Section 17, Township 105 N., Range 13 W., in Pleasant Grove Township. It is included in Major Land Resource Area 105, the Northern

Mississippi Valley Loess Hills. The elevation is about 1,280 feet above sea level.

Soils

The Mount Carroll series consists of deep, well-drained silt loams. The top 7 inches range from two to three percent organic matter, while the pH is 5.6-7.3. The subsoil pH is 5.1-6.0. Internal drainage is medium. Slopes on the site range from 2 to 18 percent. The soils are in Conservation Tree and Shrub Group 3.

Climate

Climate data is from the official weather station in Rochester, Minnesota. The mean annual precipitation is slightly less than 30 inches. In the period from 1985-1999, the annual precipitation varied from 21.4 inches in 1988 to 43.94 inches in 1990. Seventy-five percent of the annual precipitation falls during the growing season. The mean annual temperature is 43.6 degrees F. This site is in Plant Hardiness Zone 4a.

Warm-Season Grasses

The first phase of plantings made at the Fugle's Mill Demonstration Site was a study of nine species of warm-season grasses. These are grasses that complete most of their growth during the warm part of the year, generally late in the spring and in the summer. They have a different leaf anatomy and use the C₄ photosynthetic pathway to fix carbon. Photosynthesis is the process of combining carbon dioxide from the air with water from the soil to produce sugars and oxygen. C₄ plants are generally able to photosynthesize more productively under high temperatures and high light intensities, with greater water use efficiency. These conditions are typical of much of the tall-grass prairie region.

The nine species included 37 different seed sources (accessions) or cultivars which were planted

in a randomized complete block with three replications, plus an array (see photo on page 3). In the array, the entries were grouped by species. Within each species group, the entries were arranged by maturity, with the earliest maturing accession planted first and the latest maturing accession being last. Each plot was 12 feet wide by 60 feet long. The grasses were planted on June 4-5, 1985. In December

1985, the weather turned quite cold. The average mean temperature for that month was 6.3 degrees F. The normal December mean is 18.5 degrees F. A number of the accessions with southern origins suffered some winter injury. The plots were burned in the spring of 1990 and 1991. The border around each block was mowed annually. Each of the three randomized replications was evaluated from 1985-1991. The data collected included stand rating, vigor, weed contamination, and height. Forage production was calculated for the years 1987-1991. During this period, the precipitation was substantially above normal for 1990 (+14.36) and 1991 (+7.33). The precipitation was below normal for 1987 (-2.63), 1988 (-8.19), and 1989 (-6.85). A number of the entries showed great potential for biomass production. Forage quality was not evaluated at that time. On September 7, 2005, the array of grasses was evaluated for stand and vigor. It is likely that some of the selections had moved to different plots, filling in gaps left by poorly performing entries.

Big Bluestem

Seven entries of big bluestem were compared. The varieties (with origin) were 'Bison' (NDG-4), from central North Dakota; 'Bonilla' (SD-27), from east-central South Dakota; 'Sunnyview' (SD-43), from southeastern South Dakota; 'Champ', from Nebraska; 'Pawnee', from south-central Nebraska; 'Kaw', from east-central Kansas; and 'Rountree', from west-central Iowa.

Sunnyview and Pawnee had the highest average forage yields for the 5-year period, at 1.7 tons per acre. Stand ratings were good to excellent during the 5-year period, except for Kaw, which had winter injury. All entries generally had mature seed at the end of the growing season, except Pawnee, Rountree, and Kaw. At the end of the 2005 growing season, Sunnyview and Rountree had the best vigor.

Sand Bluestem

The varieties 'Garden' and 'Goldstrike' were compared. Both are from Nebraska. Garden was taller and more vigorous over the study period. The forage yield for Garden was twice that of Goldstrike. Garden averaged 1.7 tons per acre. Both entries had poor vigor after the 2005 growing season.

Indiangrass

Five entries of Indiangrass were evaluated. The varieties included ‘Tomahawk’ (ND-444), from south-central North Dakota and north-central South Dakota; ‘Holt’, from northeastern Nebraska; ‘Oto’, from Kansas-Nebraska; ‘Osage’, from Kansas-Oklahoma; and ‘Rumsey’, from Illinois. Oto, Osage, and Rumsey had winter injury following the year of establishment. Tomahawk and Holt were the only entries to make mature seed each year that phenology data was collected. Tomahawk and Holt had the highest 5-year average stand ratings. Holt produced 1.2 tons per acre and had the best stand at the end of the 2005 growing season.

Prairie Sandreed

Three entries of prairie sandreed were compared. These selections included PI-477007, from Michigan; ND-95 (Bowman), from southwestern North Dakota; and ‘Goshen’, from eastern Wyoming. The best performer in all categories was the selection from Michigan. All three entries appeared similar in plant phenology, and had mature seed at the end of the growing season. Forage production for the Michigan entry, with 0.6 tons per acre, was approximately twice that of the other two western selections. The Michigan selection had the best stand after the 2005 growing season.

Switchgrass

Ten entries of switchgrass were evaluated. The accessions included ‘Dacotah’ (NDG-965-98), from central North Dakota; ‘Sunburst’, from southeast South Dakota; ‘Forestburg’ (SD-149), from east-central South Dakota; Neb-28, from north-central Nebraska; ‘Summer’, from southeast Nebraska; ‘Pathfinder’, from Nebraska; ‘Trailblazer’, from Nebraska; ‘Cave-in-Rock’, from southern Illinois; ‘Blackwell’, from north-central Oklahoma; and NJ-50, from New Jersey. Summer had the highest average forage production in 1990 and 1991, and also for the 5-year period, at 2.2 tons per acre. Sunburst was the next highest forage producer, with 1.8 tons per acre for these same years. Dacotah had the earliest maturity with mature seed as early as August 29 in 1991. NJ-50 had the poorest 5-year average stand rating. After the 2005 growing season, there was very little difference in vigor between all the switchgrass entries.

Little Bluestem

Four cultivars of little bluestem were compared. The entries included ‘Blaze’, from Nebraska; ‘Camper’, from Nebraska; ‘Aldous’, from Kansas; and ‘Cimarron’, a composite from a collection made in Kansas, Colorado, New Mexico and Oklahoma. The average forage yields (1.4 tons per acre) for the 5-year period were comparable, as were stand and vigor ratings. All four entries were late in maturity, due to their southern origin. None of the entries made mature seed during the 4-year period that plant phenology data were collected. Aldous and Cimarron both showed winter injury the year after establishment. At the end of 2005, Cimarron had the poorest stand.

Sideoats Grama

Four cultivars of sideoats grama were evaluated. The four entries included ‘Killdeer’, from western North Dakota; ‘Pierre’, from central South Dakota; ‘Trailway’, from northeast Nebraska; and ‘Butte’, from northeast Nebraska. Trailway had the highest average forage production for the 5-year period. Trailway also had some winter injury the year after establishment. Forage yields for all entries were low, i.e., less than 0.5 tons per acre, except in

1987. All cultivars had mature seed by the end of the growing season. Trailway had the best stand after the 2005 growing season.

Eastern Gamagrass

One entry of eastern gamagrass, K-24, from Kansas, was evaluated. Stand density averaged one plant per square foot, although all plots had large open areas between plants. Forage production was not good, averaging less than 0.5 tons per acre in 1990 and 1991. Some dead crowns were also identified in the plots in 1991. Limited seed culms were produced in the plots, though maturity was early and mature seed was documented in late August.

Caucasian Bluestem

One entry of Caucasian bluestem, PI-78758, from central Asia, was evaluated. Severe winter injury was documented the first year after establishment. The remaining plants did recover and the 5-year average forage yield was close to 1.5 tons per acre. More than 2.5 tons per acre were harvested in 1988. Mature seed was recorded at the end of the growing season during all years evaluated, except 1990. By 2005, this entry had died out.

Trees and Shrubs

One of the principal tasks of the Plant Materials Center has always been tree improvement. This has involved seed source studies, selection of superior plants, progeny testing, and the establishment of seed orchards. Some of the new tree and shrub species that the PMC began evaluating in the 1950s were grown from seed collected at the Agriculture and Agri-Food Canada Arboretum in Morden, Manitoba. Many new plants were made available to soil conservation districts for windbreaks from these Canadian collections.

In the spring of 1986, a selection of these promising woody plants was established in the Off-Center Evaluation Planting at Fugle's Mill. The PMC staff, with the assistance of the NRCS Area Office and State Office staff, as well as the Olmsted County Soil and Water Conservation District personnel annually added new plants until 1995. A complete list of all species and accessions that were planted is recorded in **Table 2**.

The trees and shrubs planted were provided by private nurseries and other USDA agencies. A number of the accessions came from other countries, often by way of the Plant Introduction Stations operated by the USDA Agricultural Research Service. In the period from 1986-1995, a total of 137 different accessions of 96 different species were planted. There were often great differences in performance between different accessions within a species. Only by observing these plants over a number of years at several locations, is it possible to find the best plants for conservation use.

Planting Plan

The plots were not randomized or replicated but systematically arranged for ease of evaluation and demonstration purposes. In Block I, the woody plants were planted on the contour in long rows. Block II consisted of shrubs; Block III poplars; while Block IV consisted of willows. Black walnut was planted as a border around Block I. Due to the sloping terrain, the land between the rows was left in the previous cover of grass and alfalfa.

Plot Maintenance

The grass strips between the tree rows have been mowed. For several years, a mechanical cultivator was used to control the grass growing around the trees. Starting in 1988, the herbicide Casaron® was applied each fall for several years. Damaged plants have been removed. Since the trees were first planted, conservationists' perceptions of what are desirable plants has changed. The use of the term 'invasive' has become very common, though not all agree on the definition. Some of the woody plants established in the 1980s have spread by birds using the fruit. In May 2006, a work crew removed the autumn olive. The autumn olive plants were cut to the ground and treated with the herbicide, Garlon® and/or glyphosate.

Work crew removing autumn olive

Evaluations and Results

Information on planting date, survival, vigor, canopy width, and plant height were recorded starting in 1986. In the fall, measurements were taken on selected plants. The plants were evaluated annually until 1999. An evaluation schedule, based on year of planting, was followed for each accession. Species have remained the same since 1999. These plants are shown on **Table 3**.

In the 20 years since the planting was established, the extremes of temperature and precipitation, combined with the pressure from the competing grass cover, has had an effect on plant survival. One of the key measures of performance is plant vigor, which is a combination of plant form and plant health. In May 2006, a quick review of the trees was made. Some of the trees and shrubs are doing very well. The accessions that show better than average vigor are listed in **Table 1**.

Table 1: Best Performing Plants

'Midwest' crabapple	9063143 red Tatarian honeysuckle
'Imperial' poplar	ND-3779 Siberian pea shrub
ND-3803 white poplar	'Meadowlark' forsythia
9063130 river birch	ND-1879 honey locust
ND-1729 Siberian larch	Clone C austree
9057413 ponderosa pine	'Streamco' willow
ND-2502 ponderosa pine	'Flame' Amur maple
9057426 Douglas fir	ND-629 Amur maple
9058862 tamarack	

Since 1973, the Bismarck PMC has released 14 varieties of woody plants. Most of those species were included in the planting. Information gathered from evaluation of these plants was used to help support their release.

In recent years, some of the released plants have declined in vigor. The 'McDermand' Ussurian (Harbin) pear, 'Cardan' green ash, and 'Midwest' Manchurian crabapple continue to show average or better vigor.

<i>Salix purpurea</i>	'Streamco'	purpleosier willow	1986		Europe/PMC, Big Flats, NY

			Year	Year	
Scientific Name	Accession	Common Name	Planted	Removed	Origin/Source
<i>Shepherdia argentea</i>	'Sakakawea'	silver buffaloberry	1986		Morden, MB
	ND-3764	silver buffaloberry	1986		Lincoln-Oakes Nursery, Bismarck, ND
<i>Syringa pekinensis</i>	ND-686	Pekin lilac	1986		Asia/Lincoln-Oakes Nursery, Bismarck, ND
<i>Syringa villosa</i>	'Legacy'	late lilac	1986		China/Morden, MB
<i>Thuja occidentalis</i>	ND-3787	northern white cedar	1986		U of M, St. Paul, MN
<i>Tilia cordata</i>	9069081	littleleaf linden	1993		Europe/Lee Nursery, Fertile, MN
<i>Ulmus japonica</i>	9063126	Japanese elm	1992	1998	Manchuria/PFRA, Indianhead, SK
<i>Ulmus parvifolia</i>	'Elsmo'	Chinese lacebark elm	1990	1992	Asia/PMC, Elsberry, MO
<i>Viburnum lentago</i>	ND-21	nannyberry	1986		ARS, Mandan, ND
<i>Viburnum opulus</i>	399414	European cranberry	1988		Yugoslavia/ARS, Ames, IA
<i>Viburnum trilobum</i>	9031856	American cranberrybush	1986		USDA, PMC, Rose Lake, MI
	9031878	American cranberrybush	1986		WI/USDA, PMC, Rose Lake, MI

Key to Table 3. Evaluation Data of Woody Species at Fugle's Mill Demonstration Site (Study 38I340K Field Evaluation of Woody Plant Materials, Rochester, Minnesota)

PLOT LOCATION = plot location of the plant material within the evaluation

ACCESSION NUMBER = any accession number, PI number or cultivar name assigned to the plant material

PLANT SYMBOL = plant symbol of the genus and species

GENUS/SPECIES = common name and scientific name of the plant material

ORIGIN/SOURCE = origin and/or source of the plant material

TRANS DATE = month and day the plant material was transplanted at the evaluation site

YR PLT = year the plant materials were transplanted at the evaluation site

YR REC = year of record

MATL PLTD = type of material planted, PLBR = bareroot, CONT = containerized

NO PLTS = number of plants planted in the plot

NO SRV = number of plants surviving

PCT SRV = percent of plants surviving

VI = plant vigor (1=excellent, 3=good, 5=fair, 7=poor, 9=very poor)

CAN COV (ft) = canopy cover measured in feet

PLT HT (ft) = plant height measured in feet
